

COURSE SLIDES

Generative AI for Video Creation

Course Code: C1373

Conducted by Tertiary Infotech Academy Pte Ltd · UEN 201200696W

Version v1.0 · 28 July 2026

© 2026 Tertiary Infotech Academy Pte Ltd. All rights reserved. · www.tertiarycourses.com.sg

COURSE ADMINISTRATION

Welcome & Housekeeping

Course Trainer Profiles

1

Allen Wong

Digital marketing strategist and ACTA-certified trainer with cross-industry experience in data-led campaigns, e-commerce growth and practical AI-assisted marketing.

Let's Know Each Other

- 1 Your name, role and the short-form channel or audience you work with.
- 2 Your current experience with AI assistants, generated media or video editing.
- 3 One production bottleneck and one trust risk you want this course to address.

Ground Rules

1

Set your mobile phone to silent mode.

2

Participate actively — no question is too small.

3

Mutual respect: agree to disagree.

4

One conversation at a time.

5

Be punctual; return from breaks on time.

6

Learn by doing — try every hands-on lab.

Access Course Materials

Course page: <https://www.tertiarycourses.com.sg/generative-ai-for-video-creation.html>

Lesson Plan — 2 Days, 15 instructional hours

Course sequence

- Day 1 — Audience, prompts, ideas, scripts and a coherent content system
 - Topic 1: Getting Started with Generative AI for TikTok (Labs 1–2)
 - Topic 2: Generating Scripts, Ideas and Hooks with AI (Labs 3–4)

Day 2

- Day 2 — Generated media, editing, publishing, analytics and scaled production
 - Topic 3: Creating and Editing Videos with Generative AI (Labs 5–6)
 - Topic 4: Publishing, Optimising and Scaling TikTok Content (Labs 7–8)
- Daily timing
 - 9:30 am – 6:30 pm (1-hour lunch; two 15-minute tea breaks; 7.5 instructional hours)

Learning Outcomes

1

Audience & AI

Explain how short-form recommendation systems, audience signals and responsible generative AI practices shape video decisions.

2

Ideate & Script

Use structured prompts to generate audience-relevant ideas, hooks, scripts, captions, hashtags and a coherent content plan.

3

Create & Edit

Create and edit a brand-consistent vertical video with generated visuals, voiceover, captions, sound and a documented rights check.

4

Publish & Improve

Prepare, publish, analyse, repurpose and scale short-form video content through an evidence-led production workflow.

How You'll Learn

CORE CONCEPTS

The Human-Led AI Video Production System

Six Ideas That Keep Video Useful and Trustworthy

1

Audience before output

Start with a real viewer job, not an exciting generator feature.

2

One promise

Every short video earns attention by making and fulfilling one clear promise.

3

Proof boundary

Use approved facts and mark unknowns instead of asking AI to fill gaps.

4

Scene function

Each visual or sound orients, demonstrates, proves, transitions or closes.

5

Rights and disclosure

Record source, permission, commercial status and significant AI alteration.

6

Learn through signals

Use relevant metrics and one-variable tests, not algorithm myths.

The A-P-P-S-O-R Prompt Pattern

1

Audience

Name the viewer, situation, tension and desired outcome.

2

Purpose

State the one job the content should perform.

3

Proof

Supply approved facts, examples and source boundaries.

4

Style

Set voice, visual, pacing, brand and avoid rules.

5

Output

Specify concepts, duration, beats, columns and file hand-off.

6

Review

Require truth, rights, disclosure, accessibility and feasibility checks.

THE CORE IDEA

AI accelerates production; people own the promise, proof and publish decision.

A strong short-form workflow combines creative variation with audience relevance, traceable assets and deliberate human review.

What You Will Build

Discover

- An audience and prompt brief
- A scored idea bank with hook alternatives

Design

- A timed script and storyboard
- A four-week brand-consistent content system

Produce

- A generated asset and rights register
- A captioned vertical review export

Improve

- A publish and adaptation pack
- An analytics-led iteration and scaling plan

The Eight-Lab Learning Arc

1

Brief — define the audience, source facts, tool roles and responsible-use boundary.

2

Explore — generate distinct angles and hooks, then select with explicit criteria.

3

Script — coordinate spoken line, visual, on-screen text and timing.

4

Systemise — turn the same brand promise into a sustainable content calendar.

5

Generate — create candidate visuals and voice with provenance and quality checks.

6

Edit — assemble, caption, mix, preview and export a vertical video.

7

Publish — package metadata, settings, rights, disclosure and adaptations.

8

Learn — diagnose synthetic performance data and design the next controlled test.

The Content Traceability Chain

Four Checks Before Any Export

1

Message

Does the body fulfil the opening promise for the intended audience?

2

Media

Are visuals, voice, captions, timing and sound coherent and readable?

3

Trust

Are facts, permissions, rights and AI disclosure complete?

4

Delivery

Are format, safe zones, settings, owner and next action correct?

TOPIC 01

Getting Started with Generative AI for TikTok

Short-form video and GenAI · Tool setup · Recommendation signals and audience · Effective prompting

Key Concepts — Getting Started with Generative AI for TikTok

1

Short-form story

A focused promise, fast proof and clear next action designed for vertical, mobile viewing.

2

Recommendation signals

Viewer interactions, content information and user context influence what each person is shown.

3

Production stack

An AI assistant plans; a generator creates candidate media; an editor assembles and checks the video.

4

Prompt brief

Audience, purpose, source facts, creative constraints, output format and review gates make generation useful.

Introduction to Short-Form Video and Generative AI

WHAT

- Short-form video communicates one useful idea through a compact visual and audio sequence. Generative AI can propose concepts, draft scripts, create candidate images or clips, synthesize voice and accelerate edits, but it does not know the brand truth, audience context or usage rights unless a person supplies and checks them.

WHY IT MATTERS

- The production bottleneck is rarely a lack of generated material; it is choosing a relevant promise and turning it into a coherent viewing experience. A human-led workflow separates message decisions from media generation and keeps the creator accountable for truth, permission, safety and final quality.

HUMAN CHECK

- Ground the task in approved facts.
- Review evidence, privacy, rights and tone.
- Approve, edit or stop before use.

How It Works — Introduction to Short-Form Video and Generative AI

In Practice — Introduction to Short-Form Video and Generative AI

WORKED EXAMPLE

- Harbour Bean Co. wants busy office workers to improve bitter pantry coffee.
- The video promises three practical fixes, demonstrates each fix and closes with a save-this checklist.
- AI supplies draft options; the creator verifies every product and brewing claim against the synthetic source pack.

DECISION GUIDE

- **Use when**
 - You have a bounded message and approved source material.
 - AI can reduce drafting or production time while a person reviews the result.
- **Avoid when**
 - The idea depends on an invented claim, copied creator identity or unlicensed asset.
 - The workflow would publish generated output without a full human preview.

Quality Lens — Introduction to Short-Form Video and Generative AI

FAILURE SIGNAL

- The clip looks polished but the viewer cannot state its one useful promise.

REPAIR MOVE

- Rewrite the concept as audience + problem + promised value in one sentence.

QUALITY EVIDENCE

- Every scene supports the promise and the creator can trace its factual claims.

Setting Up AI Tools for Video Creation

WHAT

- A practical tool stack has three roles: a language assistant for research and scripting, a media generator for candidate visuals or voice, and a nonlinear editor for timing, captions, sound and export. One product may cover several roles, but the files, settings and review gates should remain visible and portable.

WHY IT MATTERS

- Tool features, plans and labels change quickly. Designing around durable jobs rather than one button lets creators switch products, use an offline fallback and preserve the project when a feature or account is unavailable.

HUMAN CHECK

- Ground the task in approved facts.
- Review evidence, privacy, rights and tone.
- Approve, edit or stop before use.

How It Works — Setting Up AI Tools for Video Creation

In Practice — Setting Up AI Tools for Video Creation

WORKED EXAMPLE

- The C1373 project stores 01-source, 02-script, 03-media, 04-edit and 05-export artifacts.
- A generated coffee-pour clip is saved with its prompt and rights note instead of remaining only in a tool history.
- If text-to-video is unavailable, the storyboard is completed with supplied synthetic stills or authorised stock.

DECISION GUIDE

- **Use when**
 - Several tools contribute to one production and provenance must remain clear.
 - You need a repeatable folder and file hand-off between ideation and editing.
- **Avoid when**
 - A tool requires protected business data that is not approved for that service.
 - The production depends on one premium feature with no fallback or export route.

Quality Lens — Setting Up AI Tools for Video Creation

FAILURE SIGNAL

- Files are named final2-new-final and no one knows their source.

REPAIR MOVE

- Use scene-purpose-version names and a simple asset register.

QUALITY EVIDENCE

- Another learner can reopen the project and identify every required source file.

Understanding the TikTok Recommendation System and Audience

WHAT

- TikTok describes recommendation as a prediction process influenced mainly by user interactions, content information and user information. For many viewers, interactions such as watch time, completion, skips, likes, shares and comments carry substantial weight, while search also considers how well content matches the query.

WHY IT MATTERS

- There is no universal algorithm trick. Creators improve relevance by serving a clear audience need, earning attention honestly, making the subject legible through words and visuals, and studying how real viewers respond instead of optimising for myths.

HUMAN CHECK

- Ground the task in approved facts.
- Review evidence, privacy, rights and tone.
- Approve, edit or stop before use.

How It Works — Understanding the TikTok Recommendation System and Audience

In Practice — Understanding the TikTok Recommendation System and Audience

WORKED EXAMPLE

- Audience: office workers using basic pantry equipment.
- Moment: the first sip tastes bitter and they want a quick fix before the next meeting.
- Opening: a close-up of the brew plus 'Bitter office coffee? Fix these 3 things.'
- The topic and wording are relevant even if a trending sound is not used.

DECISION GUIDE

- **Use when**
 - You can state a specific viewer problem and observable benefit.
 - Analytics or direct audience feedback can inform the next iteration.
- **Avoid when**
 - The plan relies on engagement bait, misleading suspense or unrelated trending tags.
 - A single post's result is treated as proof of a permanent platform rule.

Quality Lens — Understanding the TikTok Recommendation System and Audience

FAILURE SIGNAL

- The brief says only 'people on TikTok'.

REPAIR MOVE

- Add audience, moment, problem, desired outcome and evidence source.

QUALITY EVIDENCE

- The hook, content and next action all serve the same viewer job.

Effective Prompting for Video Ideas and Content

WHAT

- A video prompt is a production brief expressed as instructions. The course uses A-P-P-S-O-R: Audience, Purpose, Proof, Style, Output and Review. This structure grounds creative variation in source facts while making format and quality requirements observable.

WHY IT MATTERS

- Vague prompts generate generic lists and can hide invented claims. A structured prompt produces alternatives that can be compared, shows where evidence is missing and creates reusable hand-offs from idea to script, shot list and edit.

HUMAN CHECK

- Ground the task in approved facts.
- Review evidence, privacy, rights and tone.
- Approve, edit or stop before use.

How It Works — Effective Prompting for Video Ideas and Content

In Practice — Effective Prompting for Video Ideas and Content

WORKED EXAMPLE

- Audience: busy Singapore office workers; purpose: teach three fixes for bitter pantry coffee.
- Proof: use only the supplied Harbour Bean source pack.
- Output: five 25–35 second concepts with hook, proof, scenes and save-worthy takeaway.
- Review: flag any claim or asset that needs a source or permission.

DECISION GUIDE

- **Use when**

- The source pack and desired output can be clearly bounded.
- You need several alternatives that share the same strategic brief.

- **Avoid when**

- The prompt asks AI to imitate a living creator or fabricate customer proof.
- The creator plans to select by excitement without checking fit, evidence and feasibility.

Quality Lens — Effective Prompting for Video Ideas and Content

FAILURE SIGNAL

- Five options are merely five phrasings of the same generic idea.

REPAIR MOVE

- Require distinct angles, mechanisms or viewer tensions and a comparison rubric.

QUALITY EVIDENCE

- Each chosen idea links audience need, approved proof and a feasible production path.

Hands-On Labs — Getting Started with Generative AI for TikTok

Lab 1

- Build the Audience, Tool and AI Prompt Brief

Lab 2

- Create and Score an AI Video Idea and Hook Bank

Build the Audience, Tool and AI Prompt Brief

LAB 1

You will read the synthetic Harbour Bean brand and audience sources, define one precise viewer job, map the production stack and use the A-P-P-S-O-R pattern to generate a grounded video brief. You will review an initial and refined AI response instead of treating fluent creative output as verified truth.

You'll build

A 01-audience-prompt-brief.md containing approved brand facts, an audience-job statement, recommendation-signal hypotheses, a tool-role map, one reusable A-P-P-S-O-R prompt, two AI-response versions and a claim-to-source ledger.

1 Inspect sources

2 Define audience

3 Check tool roles

4 Prompt and verify

Tools: Text editor · ChatGPT, Claude or Copilot · supplied synthetic source pack

Build the Audience, Tool and AI Prompt Brief

Test it

Open 01-audience-prompt-brief.md. It must contain all ten source headings, one complete audience-job sentence, three labelled recommendation hypotheses, seven tool-role rows, a six-part A-P-P-S-O-R prompt, two labelled AI responses, no unsupported claim marked OK and all six readiness lines.

Create and Score an AI Video Idea and Hook Bank

LAB 2

You will turn the Lab 1 brief into an idea bank across mistake, demonstration, comparison, myth, checklist and story angles. You will write verbal, visual and text-overlay hooks, reject misleading options and score the survivors before locking the Harbour Bean production concept.

You'll build

A completed 02-idea-hook-bank.csv with twelve concepts and a 02-selected-concept.md with the chosen angle, primary hook, alternate hook, body promise, proof source, next action, production risks and a one-variable future test.

1 Generate angle families

2 Write multimodal hooks

3 Score consistently

4 Lock the concept

Tools: Spreadsheet · text editor · AI assistant · idea-hook-bank-template.csv

Create and Score an AI Video Idea and Hook Bank

Test it

02-idea-hook-bank.csv must contain exactly twelve eligible rows across all six angle families, three hook channels per row, five numeric scores, a total and decision note. 02-selected-concept.md must contain every required heading, one primary and one alternate hook, one stated test variable, at least three keep-constant items, the before/after fulfilment check and a Rejected ideas log containing every replaced ID and reason, or the line 'No ideas rejected'.

Recap — Getting Started with Generative AI for TikTok

1

You can now: LO1: explain the audience, recommendation-signal and responsible-use choices that govern a generative AI video workflow

2

You can now: LO1: connect audience needs and recommendation signals to truthful, testable short-form video concepts

TOPIC 02

Generating Scripts, Ideas and Hooks with AI

Ideas, angles and hooks · Scripts, captions and hashtags · Series and content calendars · Brand voice and style

Key Concepts — Generating Scripts, Ideas and Hooks with AI

1

Angle

The specific lens that makes a familiar subject useful to this audience now.

2

Hook-body-close

The opening earns attention, the body delivers proof and the close completes the promise.

3

Beat sheet

A time-boxed map of spoken line, visual, on-screen text and sound for each moment.

4

Content system

A repeatable relationship among audience problem, pillar, format, evidence and next action.

Generating Video Ideas, Angles and Hooks

WHAT

- A topic is broad; an angle selects the specific tension, perspective or transformation. A hook is the first clear signal of relevance, delivered through spoken words, on-screen text, visual action or sound. Effective hooks promise value without withholding essential context or misleading the viewer.

WHY IT MATTERS

- AI can produce many openings quickly, but volume alone creates sameness. Separating angle generation from hook writing and scoring options against relevance, clarity, proof and production feasibility produces more useful variety.

HUMAN CHECK

- Ground the task in approved facts.
- Review evidence, privacy, rights and tone.
- Approve, edit or stop before use.

How It Works — Generating Video Ideas, Angles and Hooks

In Practice — Generating Video Ideas, Angles and Hooks

WORKED EXAMPLE

- Topic: better office coffee.
- Mistake angle: 'Your water is not the only reason office coffee tastes bitter.'
- Demonstration angle: show two brews side by side before naming the three variables.
- Checklist angle: 'Before your next cup, check grind, ratio and contact time.'

DECISION GUIDE

- **Use when**

- A verified subject can support several useful perspectives.
- The production team can demonstrate or source the promised proof.

- **Avoid when**

- The hook implies a result the body cannot deliver.
- The idea copies a recognisable creator's phrase, face, voice or signature treatment.

Quality Lens — Generating Video Ideas, Angles and Hooks

FAILURE SIGNAL

- The hook is loud but no audience benefit appears in the first moments.

REPAIR MOVE

- Name the viewer problem and promised takeaway explicitly.

QUALITY EVIDENCE

- A colleague can predict the body from the hook and finds the promise fulfilled.

Writing Scripts, Captions and Hashtags with AI

WHAT

- A short-form script coordinates narration, visuals, on-screen text and timing rather than presenting a block of prose. Captions improve comprehension and accessibility; post descriptions and hashtags add truthful context and discovery cues but should not be used to disguise an unrelated subject.

WHY IT MATTERS

- Writing each channel separately causes repetition or conflict. A beat sheet lets the creator see whether spoken lines, visuals and text complement one another, while a claim ledger prevents fluent AI copy from turning assumptions into facts.

HUMAN CHECK

- Ground the task in approved facts.
- Review evidence, privacy, rights and tone.
- Approve, edit or stop before use.

How It Works — Writing Scripts, Captions and Hashtags with AI

In Practice — Writing Scripts, Captions and Hashtags with AI

WORKED EXAMPLE

- 0–3s: bitter-cup reaction and problem statement.
- 3–21s: three fixes shown with labelled close-ups.
- 21–28s: before/after comparison and concise recap.
- 28–32s: 'Save this before your next office brew' and accessible post description.

DECISION GUIDE

- **Use when**
 - The message must fit a precise duration and coordinate several media channels.
 - You can review the script against an approved source pack.
- **Avoid when**
 - The caption includes irrelevant high-volume tags or hidden claims.
 - The narration is generated in a person's voice without permission.

Quality Lens — Writing Scripts, Captions and Hashtags with AI

FAILURE SIGNAL

- The script reads well but runs far beyond the target duration.

REPAIR MOVE

- Time it aloud, cut duplicate meaning and assign one job to each beat.

QUALITY EVIDENCE

- Every beat has a purpose, duration, visual and verified claim.

Planning Series and Content Calendars

WHAT

- A content series explores one audience problem through recurring, recognisable episodes. A content calendar connects each episode to a pillar, angle, source, format, production status and next action so the team can publish consistently without generating random filler.

WHY IT MATTERS

- Scaling output without a plan often repeats ideas and weakens brand trust. A calendar balances useful formats and viewer stages, reveals asset dependencies early and creates a learning agenda for future videos.

HUMAN CHECK

- Ground the task in approved facts.
- Review evidence, privacy, rights and tone.
- Approve, edit or stop before use.

How It Works — Planning Series and Content Calendars

In Practice — Planning Series and Content Calendars

WORKED EXAMPLE

- Pillar 1: office-brew fixes; Pillar 2: ingredient explainers; Pillar 3: quick equipment routines.
- Series: '30-second pantry coffee clinic' with one observable problem per episode.
- The calendar assigns one source, one owner and one measurable learning question to every row.

DECISION GUIDE

- **Use when**

- A creator has several verified themes and needs a sustainable cadence.
- Production dependencies and review responsibilities must be visible.

- **Avoid when**

- The calendar prioritises posting frequency over useful, evidenced content.
- AI-generated repetitions are published merely to fill empty dates.

Quality Lens — Planning Series and Content Calendars

FAILURE SIGNAL

- Twelve rows repeat one sales message with different dates.

REPAIR MOVE

- Vary the viewer job, angle and format while keeping the brand promise stable.

QUALITY EVIDENCE

- Each row has a distinct purpose, source, owner and learning hypothesis.

Keeping a Consistent Brand Voice and Style

WHAT

- Brand consistency is a system of choices: audience promise, point of view, vocabulary, tone, colour, typography, composition, pace, sound and disclosure practice. It does not mean every video is visually identical; it means variation remains recognisably governed.

WHY IT MATTERS

- Generative tools can drift between styles or imitate familiar internet aesthetics. A compact brand and prompt kit gives AI explicit boundaries, while side-by-side review ensures the final edit still sounds and looks like the organisation rather than the tool.

HUMAN CHECK

- Ground the task in approved facts.
- Review evidence, privacy, rights and tone.
- Approve, edit or stop before use.

How It Works — Keeping a Consistent Brand Voice and Style

In Practice — Keeping a Consistent Brand Voice and Style

WORKED EXAMPLE

- Harbour Bean voice: practical, warm, precise; avoid luxury hype and guaranteed outcomes.
- Visual anchor: daylight pantry setting, navy and copper accents, clean close-ups and readable cream captions.
- Every output is edited back to these anchors before it enters the timeline.

DECISION GUIDE

- **Use when**
 - Several people or tools contribute to one channel.
 - A recurring series needs variation without losing recognition.
- **Avoid when**
 - The brief requests imitation of a named living artist or creator.
 - Consistency is used to justify retaining a defective or misleading generated asset.

Quality Lens — Keeping a Consistent Brand Voice and Style

FAILURE SIGNAL

- Each scene looks as if it belongs to a different brand.

REPAIR MOVE

- Apply the same prompt anchors, palette, type and review checklist.

QUALITY EVIDENCE

- Independent reviewers identify the same voice and visual cues across assets.

Hands-On Labs — Generating Scripts, Ideas and Hooks with AI

Lab 3

- Write the Timed Script, Caption and Storyboard Pack

Lab 4

- Build the Brand Prompt Kit and Four-Week Content System

Write the Timed Script, Caption and Storyboard Pack

LAB 3

You will use the Lab 2 concept card to draft a hook-body-close script, then transform it into a time-coded storyboard. You will add a plain-language description and relevant tags, read the script aloud, verify every claim and create the production hand-off for Lab 5.

You'll build

A 03-video-script-storyboard.md containing the final narration, timed beat table, caption plan, post description, relevant hashtags, claim ledger, timing record and AI-draft-to-final edit comparison.

1 Draft the arc

2 Build timed beats

3 Write post copy

4 Read, time and verify

Tools: Text editor · timer · AI assistant · script-storyboard-template.md

Write the Timed Script, Caption and Storyboard Pack

Test it

03-video-script-storyboard.md must contain the source brief, retained AI draft, final narration, two recorded timings with the second between 25 and 35 seconds, an edit comparison, at least six timed storyboard rows, five caption-emphasis words, a two-sentence description, three to five relevant hashtags and no unresolved claim in the production gate.

Build the Brand Prompt Kit and Four-Week Content System

LAB 4

You will convert the Harbour Bean source and Lab 3 creative choices into a reusable brand prompt kit, three content pillars, a recurring series format and a four-week calendar. Each calendar row will name its viewer job, evidence, production owner and learning hypothesis.

You'll build

A 04-brand-prompt-kit.md and completed 04-content-calendar.csv with three pillars, one recurring series, twelve distinct episodes, owners, evidence sources, rights state and testable learning questions.

1 Define brand anchors

2 Choose pillars

3 Plan 12 episodes

4 Run consistency gates

Tools: Text editor · spreadsheet · AI assistant · content-calendar.csv

Build the Brand Prompt Kit and Four-Week Content System

Test it

04-brand-prompt-kit.md must contain all thirteen brand fields, two reusable prompts, eight continuity checks and a 30-day production rhythm naming all six cadence points. 04-content-calendar.csv must contain exactly twelve complete episode rows, four per pillar and three per week, valid workflow and rights states, a named owner and one learning hypothesis plus success signal per row. No BLOCKED row may be scheduled.

Recap — Generating Scripts, Ideas and Hooks with AI

1

You can now: LO2: generate and verify a hook-body-close script, post copy and production-ready beat sheet

2

You can now: LO2: plan a consistent short-form series and calendar grounded in audience needs, brand rules and approved evidence

TOPIC 03

Creating and Editing Videos with Generative AI

Generated visuals and B-roll · Voiceovers, avatars and text-to-video · Editing, captions and effects · Music and transitions

Key Concepts — Creating and Editing Videos with Generative AI

1

Shot function

Every visual should orient, demonstrate, prove, transition or support the next action.

2

Continuity

Subject, lighting, palette, direction and screen position remain coherent across generated scenes.

3

Editorial hierarchy

Timing, captions, voice and sound guide attention without competing for it.

4

Rights and disclosure

Source, permission, commercial music status and significant AI alteration are checked before use.

Generating Visuals, B-Roll and Images with AI

WHAT

- Visual generation converts a written description and optional reference into candidate stills or clips. B-roll supports the main message by establishing place, demonstrating action, providing proof or smoothing a transition; it should not exist merely because a generator can make it.

WHY IT MATTERS

- Generated media can contain temporal instability, impossible details, embedded marks, visual bias or inconsistent products. A shot-function plan and contact-sheet review keep the creator focused on communication and reject defects before editing time is spent.

HUMAN CHECK

- Ground the task in approved facts.
- Review evidence, privacy, rights and tone.
- Approve, edit or stop before use.

How It Works — Generating Visuals, B-Roll and Images with AI

In Practice — Generating Visuals, B-Roll and Images with AI

WORKED EXAMPLE

- Beat: demonstrate a steady pour over coffee grounds.
- Prompt: close overhead view, neutral hands, daylight pantry, copper dripper, navy surface, vertical composition, no text or logos.
- Candidates with changing dripper shape or unreadable packaging are rejected and logged.

DECISION GUIDE

- **Use when**

- A scene is illustrative and no truthful real-world capture is required.
- The prompt and resulting asset can be documented and reviewed.

- **Avoid when**

- The visual would imply a real event, endorsement or product result that did not occur.
- A real person's likeness, private location or protected asset is used without permission.

Quality Lens — Generating Visuals, B-Roll and Images with AI

FAILURE SIGNAL

- The asset is attractive but its action or object changes between frames.

REPAIR MOVE

- Simplify the motion, shorten the clip or replace it with an authorised still plus camera movement.

QUALITY EVIDENCE

- The selected asset performs one stated shot function without material artefacts.

AI Voiceovers, Avatars and Text-to-Video

WHAT

- Text-to-speech creates audio from a script; avatar tools combine generated or authorised presenters with speech; text-to-video creates moving scenes from text or images. These systems accelerate prototyping, localisation and pickup lines, but synthetic likeness and voice require consent, clear context and careful listening.

WHY IT MATTERS

- A natural-sounding voice can still mispronounce a brand, flatten meaning or imply a speaker identity that was never authorised. Reviewing intelligibility, pace, pronunciation, emotional fit and disclosure prevents speed from becoming deception.

HUMAN CHECK

- Ground the task in approved facts.
- Review evidence, privacy, rights and tone.
- Approve, edit or stop before use.

How It Works — AI Voiceovers, Avatars and Text-to-Video

In Practice — AI Voiceovers, Avatars and Text-to-Video

WORKED EXAMPLE

- The phrase 'one to sixteen brew ratio' is tested in a five-second voice sample first.
- Mispronounced brand wording is respelled or recorded by an authorised speaker.
- The final voiceover is divided by beat and aligned to the storyboard before visuals are generated.

DECISION GUIDE

- **Use when**
 - A licensed synthetic voice improves accessibility, consistency or localisation.
 - The audience will not be misled about who is speaking.
- **Avoid when**
 - The workflow clones a person's voice or likeness without explicit permission.
 - A realistic synthetic presenter would create a false endorsement or authoritative statement.

Quality Lens — AI Voiceovers, Avatars and Text-to-Video

FAILURE SIGNAL

- The voice is intelligible but rushed, flat or mispronounces key terms.

REPAIR MOVE

- Split the script, add punctuation and pronunciation guidance, then regenerate only the affected line.

QUALITY EVIDENCE

- A listener can follow the message and identify synthetic use from the planned context or label.

Editing, Captions and Effects with AI Tools

WHAT

- Editing converts selected assets into a timed argument. AI features can detect scenes, remove pauses, reframe subjects and generate captions, but the editor still decides rhythm, emphasis, continuity and whether the automatic result is accurate.

WHY IT MATTERS

- Short-form attention is easily overloaded. A clear visual hierarchy, readable captions and deliberate cuts make the message understandable with sound on or off, while a full preview catches transcription errors and abrupt AI-assisted edits.

HUMAN CHECK

- Ground the task in approved facts.
- Review evidence, privacy, rights and tone.
- Approve, edit or stop before use.

How It Works — Editing, Captions and Effects with AI Tools

In Practice — Editing, Captions and Effects with AI Tools

WORKED EXAMPLE

- The three fixes each receive a labelled close-up and a clean cut on the voiceover phrase.
- Auto captions are corrected from 'contact thyme' to 'contact time' and kept clear of interface overlays.
- A before/after comparison uses one simple split rather than several decorative effects.

DECISION GUIDE

- **Use when**
 - Automatic transcription or reframing can accelerate a reviewed edit.
 - The creator can correct errors and control the final timeline.
- **Avoid when**
 - Captions are assumed correct because the audio sounded clear.
 - Effects compete with the message or conceal continuity problems.

Quality Lens — Editing, Captions and Effects with AI Tools

FAILURE SIGNAL

- Important text is cropped, mistranscribed or hidden by platform controls.

REPAIR MOVE

- Use safe-zone guides, shorten phrases and review every caption at playback speed.

QUALITY EVIDENCE

- The video remains understandable without sound and comfortable with sound.

Adding Music, Sound and Transitions

WHAT

- Audio has layers: voice or primary sound, music, ambience and effects. Transitions connect scenes in picture and sound. For brand or product content, TikTok recommends music from its Commercial Music Library unless the creator has all necessary rights for another track.

WHY IT MATTERS

- Music creates energy but can also obscure speech or introduce a rights problem. Sound and transitions should support pacing, meaning and brand fit; a documented rights source and balanced mix are part of production quality.

HUMAN CHECK

- Ground the task in approved facts.
- Review evidence, privacy, rights and tone.
- Approve, edit or stop before use.

How It Works — Adding Music, Sound and Transitions

In Practice — Adding Music, Sound and Transitions

WORKED EXAMPLE

- A quiet pour sound establishes the demonstration, then a cleared low-key beat supports the three fixes.
- Music drops slightly under each spoken instruction and fades before the final call to action.
- The rights log names the library, track, date and intended commercial use.

DECISION GUIDE

- **Use when**
 - The source license covers the intended channel and purpose.
 - Sound contributes rhythm, clarity or an accessible cue.
- **Avoid when**
 - A trending song is used for brand promotion without commercial permission.
 - Loud effects or rapid transitions reduce intelligibility or comfort.

Quality Lens — Adding Music, Sound and Transitions

FAILURE SIGNAL

- The voice is hard to hear or the team cannot explain the music rights.

REPAIR MOVE

- Rebalance the mix and replace the track with documented cleared audio.

QUALITY EVIDENCE

- The rights log is complete and the mix works on ordinary phone speakers.

Hands-On Labs — Creating and Editing Videos with Generative AI

Lab 5

- Generate the Visual, B-Roll and Voiceover Asset Pack

Lab 6

- Edit, Caption, Mix and Export the Vertical Video

Generate the Visual, B-Roll and Voiceover Asset Pack

LAB 5

You will translate the timed storyboard into precise visual and voice prompts, create candidate media with CapCut AI or another approved generator, and complete an asset register. If a generation feature is unavailable, you will use the same prompt with an approved alternative or create a storyboard placeholder in CapCut so the edit can still be completed.

You'll build

A 03-media folder with accepted scene assets, plus any project-only placeholder clips, a voiceover track or recorded scratch narration, a 05-asset-register.csv and a 05-contact-sheet-review.md documenting prompt, version, source, continuity, rights, disclosure and accept/reject decisions.

1 Plan shot functions

2 Generate small batches

3 Review continuity

4 Register every asset

Tools: CapCut Desktop/AI video or approved generator · microphone or text-to-speech · spreadsheet · text editor

Generate the Visual, B-Roll and Voiceover Asset Pack

Test it

The 03-media folder must contain accepted scene assets for every generated or recorded file, while C1373-placeholders may supply missing beats as explicitly registered project-only clips; together they must cover at least six storyboard beats plus a voice track or scratch narration. 05-asset-register.csv must have a complete row for every generated, recorded or project-only item with no blank rights, permission, AI alteration, disclosure, continuity, quality or decision field. 05-contact-sheet-review.md must have one row for every candidate and placeholder. Asset files, project-only placeholders, register rows and review rows must reconcile one to one; no rejected asset may be marked for use.

Edit, Caption, Mix and Export the Vertical Video

LAB 6

You will create a CapCut Desktop project, assemble the storyboard beats, generate and correct captions, apply restrained transitions, balance voice and sound, preview the full result and export a review file. You will retain a quality log instead of relying on memory.

You'll build

A saved CapCut project, 06-harbour-bean-v1.mp4 and 06-edit-quality-log.md containing timeline, caption, continuity, audio, safe-zone, rights, disclosure and export evidence.

1 Build the timeline

2 Correct captions

3 Balance sound

4 Run export gates

Tools: CapCut Desktop · accepted Lab 5 media · headphones · phone-sized preview

Edit, Caption, Mix and Export the Vertical Video

Test it

06-harbour-bean-v1.mp4 must open, use a 9:16 frame, run for 25–35 seconds, contain the hook, three fixes, recap and close, and remain understandable when muted. 06-edit-quality-log.md must record every gate, the five caption terms, both audio checks, three full previews, final export settings and any external-use restriction. The edit may contain no REJECT asset.

Recap — Creating and Editing Videos with Generative AI

1

You can now: LO3: create brand-consistent candidate media and document provenance, rights, continuity and disclosure decisions

2

You can now: LO3: assemble a coherent 9:16 video and verify captions, audio, continuity, accessibility, rights and export settings

TOPIC 04

Publishing, Optimising and Scaling TikTok Content

Publishing and scheduling · Performance analysis and iteration · Cross-platform repurposing · Scaled production workflow

Key Concepts — Publishing, Optimising and Scaling TikTok Content

1

Publish gate

Message, metadata, accessibility, rights, disclosure and settings are reviewed before a post goes live.

2

Metric chain

Reach, retention, engagement and action metrics answer different questions at different stages.

3

One-variable test

Change one meaningful element while keeping the audience promise and evidence stable.

4

Production governance

Templates, owners, states, asset registers and stop rules enable quality at higher volume.

Publishing and Scheduling TikTok Videos

WHAT

- Publishing is the final packaging and governance step: video file, cover, description, relevant tags, accessibility, audience setting, disclosure, rights and timing. Scheduling separates production from release, but it does not remove the need for a final account-level preview and approval.

WHY IT MATTERS

- A technically correct export can still fail through clipped text, unclear metadata, an incorrect privacy setting or missing AI disclosure. A publish gate makes these visible and creates a recoverable record of what was approved.

HUMAN CHECK

- Ground the task in approved facts.
- Review evidence, privacy, rights and tone.
- Approve, edit or stop before use.

How It Works — Publishing and Scheduling TikTok Videos

In Practice — Publishing and Scheduling TikTok Videos

WORKED EXAMPLE

- The Harbour Bean video exports as MP4 at 1080 × 1920.
- The description names the three coffee variables without adding new claims.
- The checklist records synthetic voice and visuals, cleared music source and the appropriate creator label.

DECISION GUIDE

- **Use when**
 - The account owner has reviewed the final file and platform settings.
 - Every material asset and claim has a traceable source or permission.
- **Avoid when**
 - The post screen introduces a new unsupported claim or removes necessary context.
 - Disclosure or commercial-music requirements are unresolved.

Quality Lens — Publishing and Scheduling TikTok Videos

FAILURE SIGNAL

- The right video is uploaded with the wrong cover, setting or disclosure.

REPAIR MOVE

- Use a two-person or two-pass publish gate with saved evidence.

QUALITY EVIDENCE

- The approval log reconstructs the file, metadata, settings and reviewer.

Analysing Performance and Iterating with AI

WHAT

- Analytics describe behaviour, not creative truth. TikTok Studio provides account and post metrics such as views, engagement and audience information. A useful analysis connects the content hypothesis to the relevant metric, compares like with like and states uncertainty before proposing the next test.

WHY IT MATTERS

- AI is good at organising a supplied dataset and suggesting questions, but it can over-explain small samples or confuse correlation with cause. A baseline, denominator, comparison window and one-variable test keep iteration disciplined.

HUMAN CHECK

- Ground the task in approved facts.
- Review evidence, privacy, rights and tone.
- Approve, edit or stop before use.

How It Works — Analysing Performance and Iterating with AI

In Practice — Analysing Performance and Iterating with AI

WORKED EXAMPLE

- Synthetic data shows strong first-three-second hold but a drop during the second fix.
- The team considers pace, visual clarity and caption density as hypotheses.
- The next version shortens that beat while keeping hook, audience and offer constant.

DECISION GUIDE

- **Use when**
 - A defined hypothesis and comparable baseline exist.
 - The team can distinguish observations from interpretations.
- **Avoid when**
 - One video's result is used to declare a universal platform rule.
 - AI receives personal viewer data or invents reasons not present in the dataset.

Quality Lens — Analysing Performance and Iterating with AI

FAILURE SIGNAL

- The report lists metrics but no decision or uncertainty.

REPAIR MOVE

- Link each metric to a question, label hypotheses and select one bounded test.

QUALITY EVIDENCE

- The iteration plan names the variable, baseline, target and review date.

Repurposing Content Across Platforms

WHAT

- Repurposing preserves the core promise and evidence while adapting duration, framing, metadata, safe zones, pacing and audience expectations for another platform. It is redesign, not identical cross-posting or automatic cropping.

WHY IT MATTERS

- A strong source video can support several channels, but each surface has different controls and viewing contexts. An adaptation matrix prevents clipped subjects, duplicated captions and platform-inappropriate calls to action.

HUMAN CHECK

- Ground the task in approved facts.
- Review evidence, privacy, rights and tone.
- Approve, edit or stop before use.

How It Works — Repurposing Content Across Platforms

In Practice — Repurposing Content Across Platforms

WORKED EXAMPLE

- The 32-second vertical master becomes a 25-second Reel and a 45-second Short with an expanded explanation.
- The three verified fixes remain unchanged, but cover text and next action adapt to each surface.
- Each export uses the clean project master and its own checklist row.

DECISION GUIDE

- **Use when**
 - The core content remains relevant and rights cover the destination.
 - A platform-specific change improves fit without changing the evidence.
- **Avoid when**
 - The crop hides the demonstration or interface-safe text.
 - A music or asset license does not cover the destination or commercial purpose.

Quality Lens — Repurposing Content Across Platforms

FAILURE SIGNAL

- The same file is posted everywhere with clipped text and generic metadata.

REPAIR MOVE

- Build a destination matrix and create separate exports from the clean master.

QUALITY EVIDENCE

- Each version passes format, message, rights and accessibility review.

Scaling a Content Production Workflow with AI

WHAT

- A scalable workflow moves each content item through defined states—from brief and evidence to concept, script, assets, edit, review, publish and learn. Templates and AI reduce repeated effort; named owners, versioning, rights records and stop rules prevent quality from collapsing as volume grows.

WHY IT MATTERS

- More output magnifies weak briefs, unsupported claims and asset confusion. Production capacity should grow only when the team can see work in progress, reconstruct decisions and learn from published results.

HUMAN CHECK

- Ground the task in approved facts.
- Review evidence, privacy, rights and tone.
- Approve, edit or stop before use.

How It Works — Scaling a Content Production Workflow with AI

In Practice — Scaling a Content Production Workflow with AI

WORKED EXAMPLE

- Harbour Bean's board has Brief, Script, Assets, Edit, Review, Scheduled and Learn states.
- An item cannot enter Edit without a verified script and asset register.
- Weekly review examines both content signals and production defects before increasing cadence.

DECISION GUIDE

- **Use when**
 - The team repeats a stable workflow with clear controls and owners.
 - Templates save time without hiding evidence, rights or approval status.
- **Avoid when**
 - Automation would scrape, impersonate, spam or publish without review.
 - The team measures volume while ignoring rework, rights risk or audience value.

Quality Lens — Scaling a Content Production Workflow with AI

FAILURE SIGNAL

- Publishing volume rises while defects and rework become invisible.

REPAIR MOVE

- Add state gates, named reviewers, cycle-time and defect measures.

QUALITY EVIDENCE

- Any post can be traced from source brief through assets, approval and learning.

Hands-On Labs — Publishing, Optimising and Scaling TikTok Content

Lab 7

- Prepare the Publish, Disclosure and Repurposing Pack

Lab 8

- Analyse Performance and Build the Scaled Improvement Plan

Prepare the Publish, Disclosure and Repurposing Pack

LAB 7

You will validate the Lab 6 export, create TikTok cover and post copy, resolve rights and AI disclosure, walk through the current upload controls with a private or stop-before-post practice setting, and design platform-specific adaptations from the clean master.

You'll build

A 07-publish-and-repurpose-pack.md containing the final publish checklist, metadata, cover plan, rights and disclosure record, settings evidence, approval decision and a TikTok/Reels/Shorts adaptation matrix.

1 Validate the export

2 Package metadata

3 Check settings and
disclosure

4 Design adaptations

Tools: TikTok app or TikTok Studio practice view · text editor · Lab 6 MP4 and quality log

Prepare the Publish, Disclosure and Repurposing Pack

Test it

07-publish-and-repurpose-pack.md must identify the exact Lab 6 export, contain the cover, description, three to five relevant hashtags, complete rights/disclosure record, every publish-gate item with a status, visible practice-control evidence supported by an existing screenshot file or a trainer-witnessed offline log, a named final decision and all twelve adaptation-matrix rows for three destinations. No BLOCKED item may be described as approved.

Analyse Performance and Build the Scaled Improvement Plan

LAB 8

You will analyse supplied synthetic TikTok post data, use AI to organise—but not invent—findings, select one variable for the next version and convert the Lab 4 calendar into a governed production board with owners, gates, measures and stop rules.

You'll build

A completed 08-performance-calculations.csv, an 08-performance-iteration-plan.md and 08-production-board.csv with traceable observations, alternative explanations, a controlled test, workflow states, owners, entry/exit gates and a 30-day learning cadence.

1 Calculate comparable metrics

2 Separate observation from
cause

3 Design one test

4 Govern the pipeline

Tools: Spreadsheet · text editor · AI assistant · synthetic-tiktok-analytics.csv · Lab 4 calendar

Analyse Performance and Build the Scaled Improvement Plan

Test it

08-performance-calculations.csv must contain all five rate columns with valid percentages for every row. 08-performance-iteration-plan.md must contain the five Lab 7 hand-off fields, four checked numeric observations, at least two alternative explanations for each material pattern, missing evidence, exactly one changed variable, four or more keep-constant items, a baseline, success signal, guardrail, window and stop/continue rule. 08-production-board.csv must contain six rows, valid states, all ten governance fields and no blocked item in Scheduled. The iteration plan must also contain all four weekly cadence points, all five named process measures and all four stop rules.

Recap — Publishing, Optimising and Scaling TikTok Content

1

You can now: LO4: package a reviewed video for TikTok and adapt its invariant message to other short-form destinations

2

You can now: LO4: interpret post metrics cautiously, choose a one-variable iteration and govern a repeatable production workflow

WRAP-UP

Course Summary & Next Steps

What You Achieved

1

Audience & AI

Explain how short-form recommendation systems, audience signals and responsible generative AI practices shape video decisions.

2

Ideate & Script

Use structured prompts to generate audience-relevant ideas, hooks, scripts, captions, hashtags and a coherent content plan.

3

Create & Edit

Create and edit a brand-consistent vertical video with generated visuals, voiceover, captions, sound and a documented rights check.

4

Publish & Improve

Prepare, publish, analyse, repurpose and scale short-form video content through an evidence-led production workflow.

A Practical 30-Day Application Plan

1

Week 1 — approve the brand source pack, audience and content pillars.

2

Week 2 — script and produce two variants from one evidence-based idea.

3

Week 3 — publish through the account owner's gate and capture comparable signals.

4

Week 4 — review production defects and audience response, then choose one controlled improvement.

Keep Practising After the Course

1

Re-run the labs on your own machine — repetition is what makes the skills stick.

2

Apply the techniques to a real process or project in your own organisation.

3

Keep your downloaded C1373 course files and use the lab checkpoints to restart safely.

4

Explore the follow-on courses at www.tertiarycourses.com.sg.

CREATE WITH PURPOSE · VERIFY WITH CARE · LEARN FROM SIGNALS

Thank You!

You now have a complete human-led workflow for planning, generating, editing, publishing and improving short-form video with generative AI.
